Analog I/O

Analog inputs

Channels	4
Bandwidth (-3 dB)	300 MHz / 600 MHz switchable
Sampling rate	5 GSa/s with 1 channel, and 1.25 GSa/s with 4 channels.
Resolution	10 bits (high bandwidth) / 18 bits (low bandwidth)
Maximum voltage range	40 Vpp into 1 MΩ [1]
Input impedance	50 Ω / 1 MΩ
Input coupling	AC / DC
AC coupling corner (-3 dB) [2]	160 kHz into 50 Ω 16 Hz into 1 MΩ
Input referred noise	30 nV/√Hz @ 100 Hz
Effective number of bits (ENOB)	8.8 bits
Connector	BNC

Analog outputs

Channels	4
Bandwidth (maximum output frequency)	500 MHz (2 Vpp into 50 Ω), 100 MHz (10 Vpp into 50 Ω)
Sampling rate	1.25 GSa/s per channel
Resolution	16-bit
Voltage range	10 V_{pp} into 50 Ω
Output impedance	50 Ω
Output coupling	DC
Connector	BNC

---

[1] 50 Ω frontend impedance can only support input voltages up to 4Vpp.

[2] For Moku:Pro's shipped prior to April 2022, corners are 16 kHz into 50 Ω and 1.6 Hz into 1 MΩ

Moku:Pro's Arbitrary Waveform Generator

Description

Moku:Pro's 4 channel Arbitrary Waveform Generator can generate 4 custom waveforms with up to 65,536 points and sample rates ranging from 312.5 MSa/s to 1.25 GSa/s. Waveforms can be loaded from a file or input as a piece-wise mathematical function with up to 32 segments, enabling you to generate truly arbitrary waveforms. In burst mode, waveform generation can be triggered from input channels with start or n cycle modes. In pulsed mode, waveforms can be output with more than 250,000 cycles of dead time between pulses.
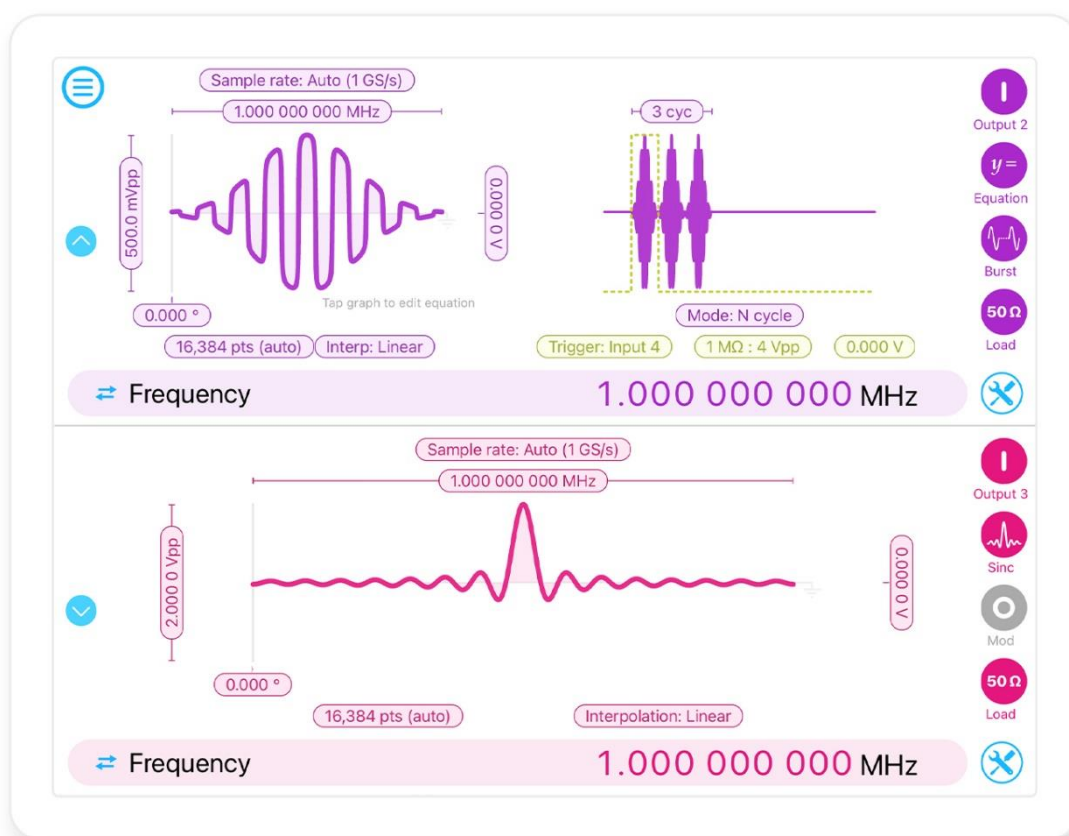

Features

- Four independent AWG channels with up to 500 MHz bandwidth
- Choose between pre-set waveforms, load points from a file, or input an equation directly
- Phase synchronization output between the four channels
- Configure pulsed output with up to 250,000 cycles of dead time between pulses

Moku:Pro's Frequency Response Analyzer

Description

Moku:Pro's Frequency Response Analyzer enables you to measure the frequency response of a system in both magnitude and phase using a swept sine output from 10 mHz to 300 MHz with a noise floor as low as -135 dBm. Moku:Pro is equipped with four inputs and four outputs ports, enabling differential or ratio metric measurements. Select up to 8192 points per sweep and configure settling and averaging times to balance total sweep duration and signal-to-noise ratio.
Features

- Linear or logarithmic swept sine output
- Math channel to add, subtract, multiply or divide response functions as they are acquired
- Measure key metrics with cursors and markers
- Configurable measurement averaging and settling times
- Demodulate up to 15th harmonic

Saving Data

Saving data

File formats	Plain text: records data using a standard *.csv format
	Binary: records data using MathWorks' *.mat format which can be opened using MATLAB
Export modes	Dropbox, E-mail and iCloud, My Files (iOS 11)

---

[3] The normalization feature can be used to isolate the magnitude and phase response of the system under test by compensating for deviations in magnitude and phase caused by delays (e.g., caused by cables) and the frequency response of the Moku:Pro's analog frontend. As an alternative the In/In1 mode may also be used, removing the need to take a normalization sweep.

Moku:Pro's Data Logger

Description

Moku:Pro's Data Logger enables you to log data to its 120 GB internal solid-state drive with sampling rates of up to 10 MSa/s. Four inputs are equipped with dual 10-bit and 18-bit ADCs. With blended ADC technology, input noise is down to 30 nV √Hz at 100 Hz, providing ultra-low noise data logging from acoustic to RF frequencies. Moku:Pro is also equipped with a 10 MHz clock synchronization I/O, and four 500 MHz outputs, allowing flexible integration with other electronics.
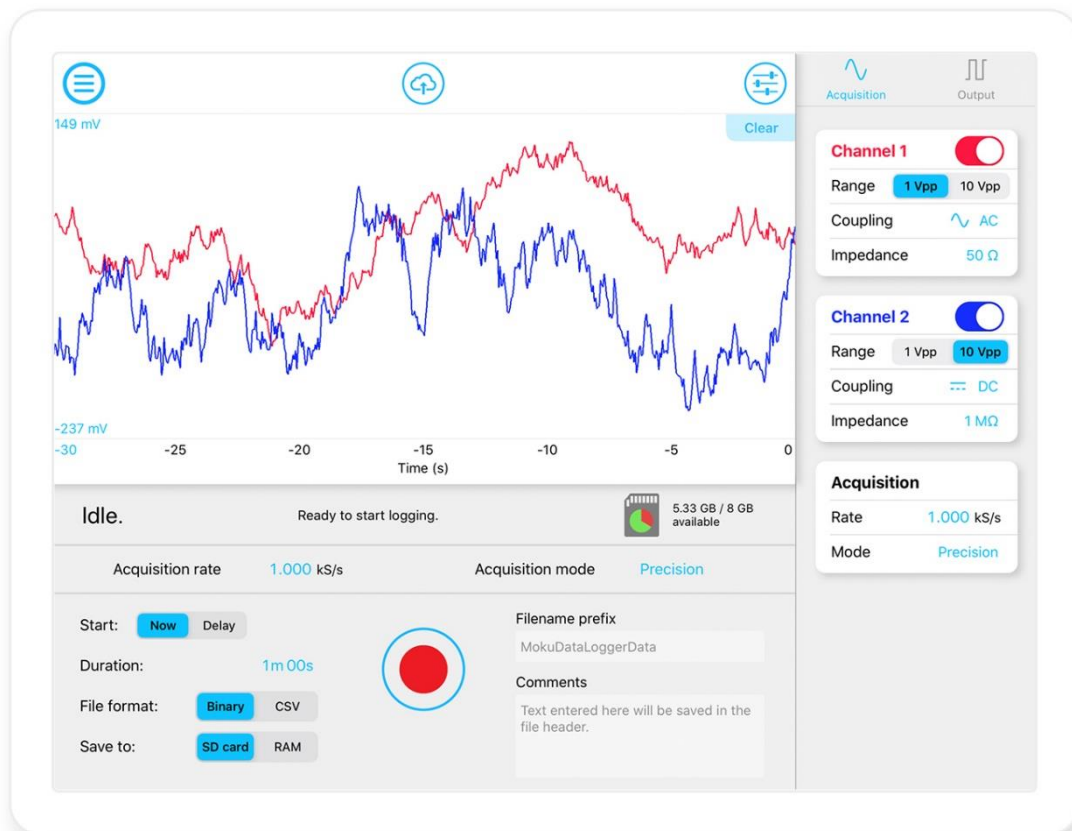

Features

- Log voltage data on four independent channels to its 120 GB SSD
- Built-in four-channel 500 MHz waveform generator
- 10 MHz clock synchronization ports
- Easily export data to computer, Dropbox, and other cloud-based services
- Schedule your log to start with a delay of up to 10 days

Moku:Pro's Digital Filter Box

Description

With Moku:Pro's Digital Filter Box, you can interactively design and generate different types of infinite impulse response filters with output sampling rates of 305.18 kHz and 39.063 MHz. Select between lowpass, highpass, bandpass, and bandstop filter shapes with up to eight fully configurable types including Butterworth, Chebyshev, and Elliptic.
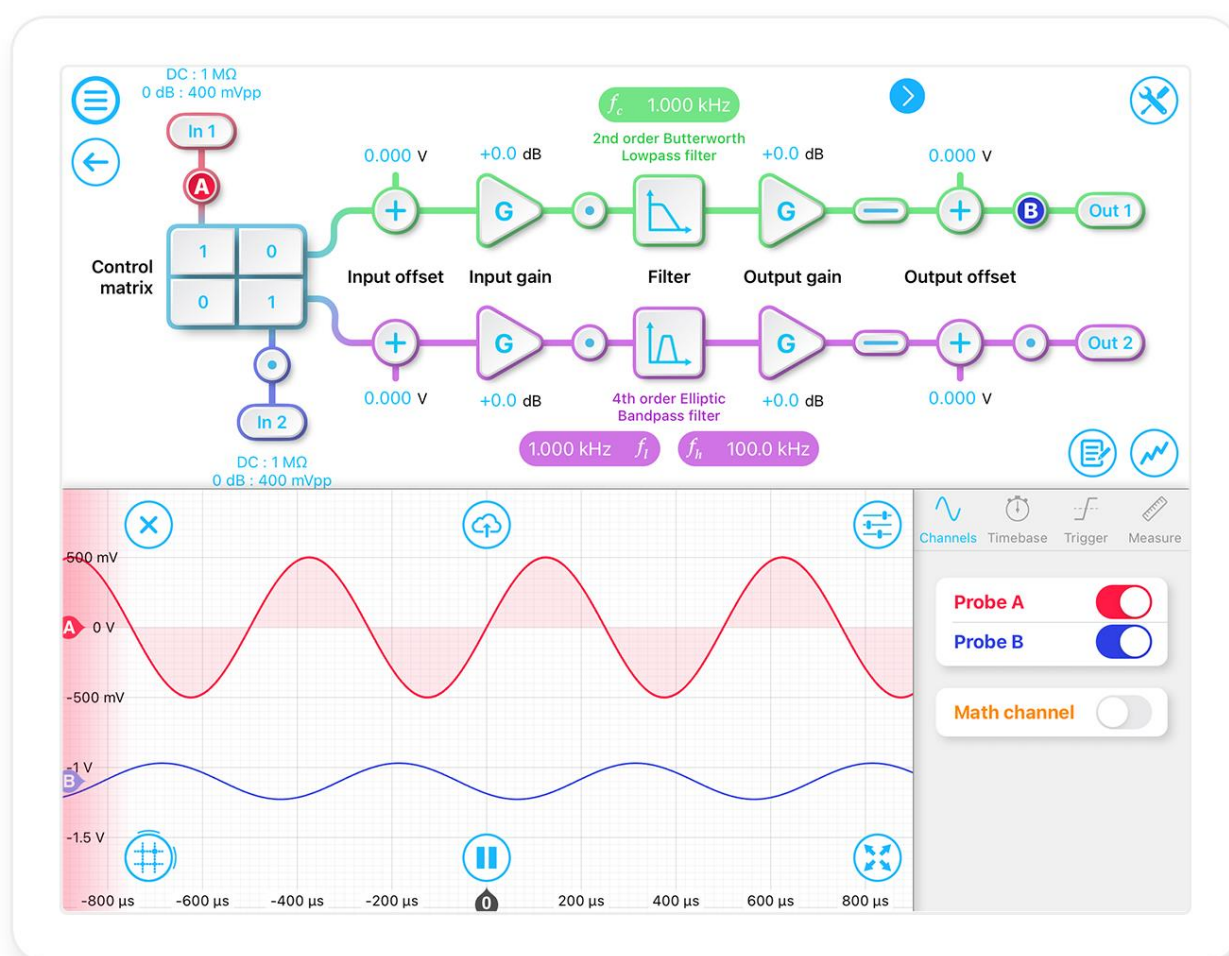

Features

- Design IIR filters using an interactive Bode plot
- Observe signals at different stages in the digital signal processing chain using probe points
- View the frequency response of your filter in both magnitude and phase
- Filter up to four channels of data simultaneously with the ability to blend input signals
- Implement custom filters by uploading your own coefficients

Minimum bandwidth	390 mHz at 305.18 kHz sampling rate 50 Hz at 39.063 MHz sampling rate

Selecting the right IIR filter

Filter type

Butterworth	Butterworth filters have a maximally flat passband and a monotonic frequency response, making them a good all-around filter type suitable for most applications.
Chebyshev I	Chebyshev I filters have ripple in the passband but a sharper transition than Butterworth filters, making them useful for applications requiring aggressive stopband attenuation but can tolerate passband ripple between 0.1 dB and 10 dB.
Chebyshev II	Chebyshev II filters have ripple in the stopband but a sharper transition than Butterworth filters, making them useful in applications requiring flat passbands and aggressive stopband attenuation.
Elliptic	Elliptic (Cauer) filters have ripple in both the passband and stopband, but also have the sharpest possible transition. Elliptic filters are useful in applications requiring extremely aggressive stopband attenuation.
Cascaded	Cascaded first-order filters have zero overshoot in the time domain.
Bessel	Bessel filters have maximally flat group and phase delay in the passband, thus preserving the wave shape of passband signals.
Gaussian	Gaussian filters have the minimum possible group delay, a step response with no overshoot, and minimum rise and fall time.
Legendre	Legendre (Optimum L) filters have the sharpest possible transition while maintaining a monotonic frequency response.

Moku:Pro's Laser Lock Box

Description

Moku:Pro's Laser Lock Box enables you to lock a laser's frequency to a reference cavity or atomic transition using high-performance modulation locking techniques. The Laser Lock Box includes a "Tap-to-Lock" feature, enabling you to quickly lock to any zero-crossing on the demodulated error signal. With Multi-instrument Mode (MiM), you can deploy up to four laser lock modules simultaneously on a single Moku:Pro. Each module shares the same clock base from the internal or an external source. This is an ideal solution for multi-laser stabilization systems.
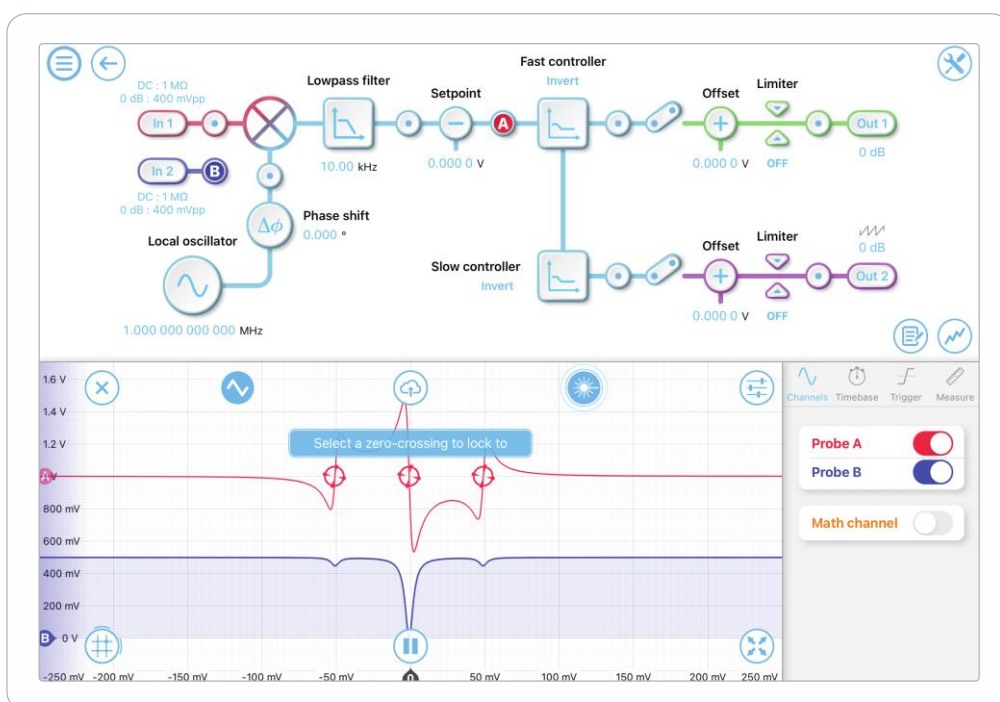

Features

- Generate modulation signals at up to 600 MHz
- Demodulate signals with internal or external local oscillators
- Scan resonances with sawtooth or triangle waveforms at up to 10 MHz
- Observe signals at different locations in the signal processing chain using an integrated oscilloscope
- Quickly lock to any zero-crossing in the error signal using the "Tap-to-Lock" feature
- Filter demodulated signals with up to fourth order infinite impulse response filters
- Individually configure high- and low-bandwidth PID controllers for fast and slow feedback

Moku:Pro's Lock-In Amplifier

Description

Moku:Pro's digital Lock-in Amplifier supports dual-phase demodulation (XY/Rθ) from 1 mHz to 600 MHz with more than 120 dB dynamic reserve. A PID controller can be placed after the demodulation stage for phase-locked loop applications. It also features an integrated 4-channel oscilloscope and data logger, enabling you to observe signals at up to 1.25 GSa/s and log data at up to 1 MSa/s.
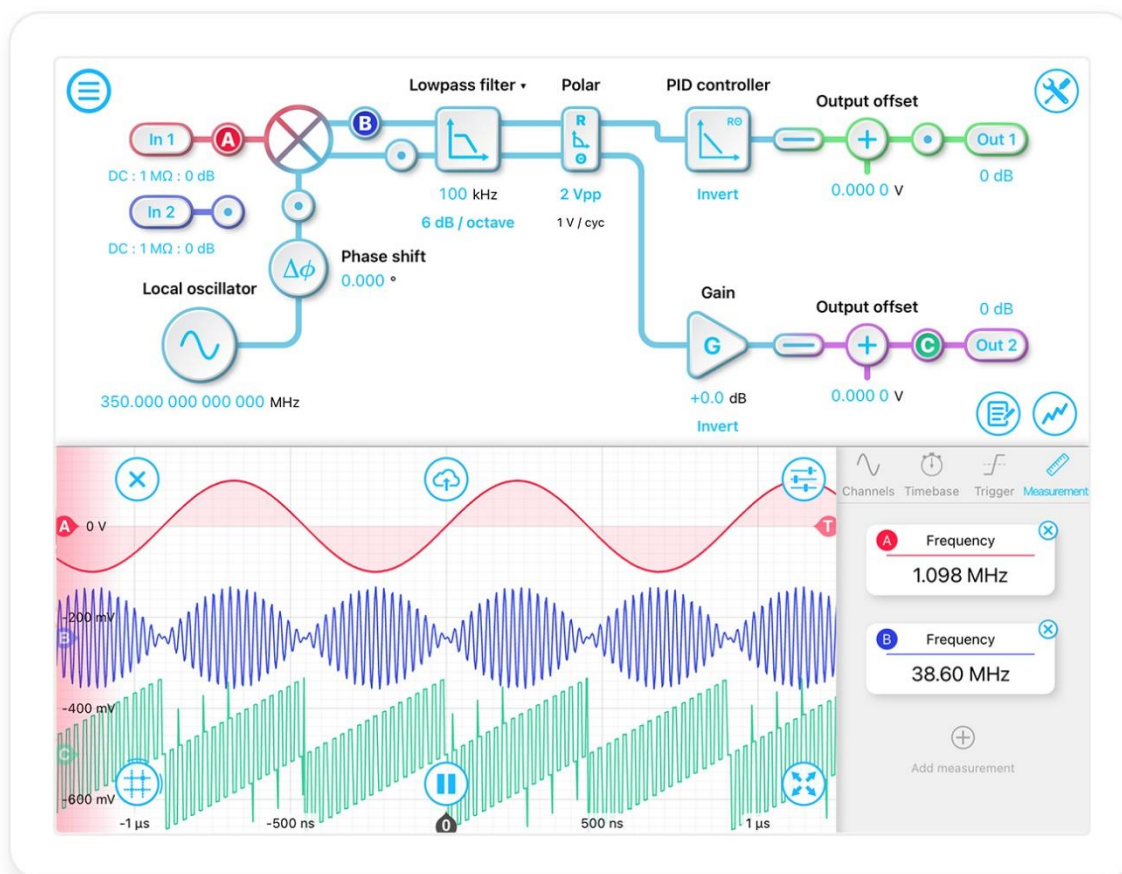

Features

- Measure signals obscured by noise with more than 120 dB dynamic reserve
- Block diagram view of the digital signal processing chain
- Built-in probe points for signal monitoring and data logging
- Internal or external demodulation modes including a PLL (phase-locked loop)
- Toggle between rectangular (X/Y mode) or polar coordinates (R/θ mode)
- Built-in PID Controller

Moku:Pro's Oscilloscope

Description

Moku:Pro's Oscilloscope features four high-speed, ultra-low noise input channels with 600 MHz analog bandwidth. An innovative blended ADC technology combines the information from 10 bit and 18 bit ADCs to cover a broad spectrum, providing class-leading input noise performance at 30nV/ √ Hz @ 100Hz with large dynamic range. The built-in four-channel waveform generators are capable of producing waveforms with a bandwidth of up to 500 MHz.

Features

- Four analog inputs with 600 MHz bandwidth
- Exceptional low-frequency noise performance: 30 nV/ √ Hz @ 100 Hz
- Dual-ADC design with blended ADC technology
- Ultra-stable 0.3 ppm onboard oscillator with 10 MHz synchronization in and out
- Integrated high-speed waveform generator channels with analog bandwidths up to 500 MHz
- Deep memory captures > 60 million samples

Moku:Pro's Phasemeter

Description

Moku:Pro's Phasemeter measures phase (relative to a reference clock) of up to four input signals with better than 6 µradian precision from 1 kHz up to 300 MHz. Based on a digitally implemented phase-locked loop architecture, Moku:Pro's Phasemeter provides exceptional dynamic range, zero deadtime, and measurement precision that exceeds the performance of conventional lock-in amplifiers and frequency counters.
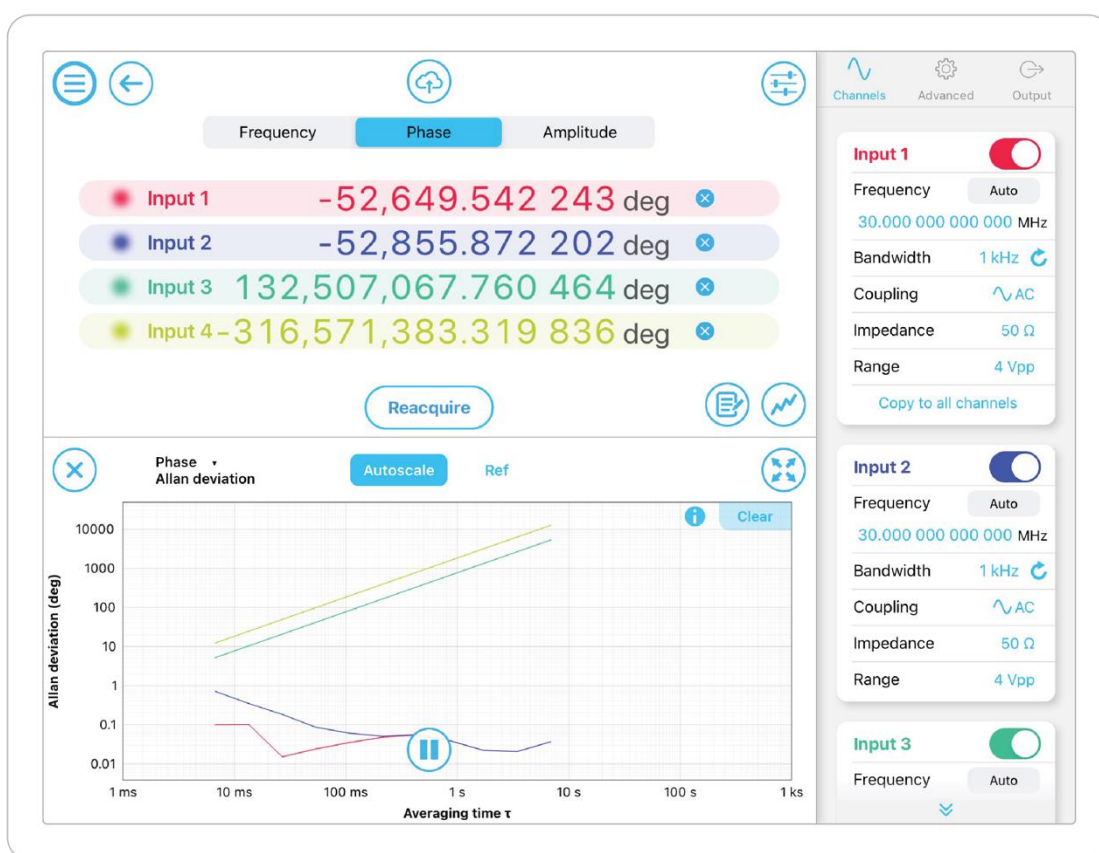

Features

- Four independent phasemeter channels with output options that track and record the phase, frequency, and amplitude of four independent signals
- Phase-locked output option enables you to generate sine waves that are phase locked to the inputs
- Observe measurement data in the frequency domain using the Phasemeter's integrated spectral analysis toolkit
- Phase-locked loop tracking bandwidths from 1 Hz up to 1 MHz
- Drive measured phase to outputs with user defined mV/degree scaling and phase wrapping

Moku:Pro's PID Controller

Description

Moku:Pro's PID Controller features four fully configurable PID controllers with sub-microsecond latency. This enables them to be used in applications requiring both low and high feedback bandwidths such as laser temperature and current stabilization. The PID Controller can also be used as a lead-lag compensator by saturating the integral and differential controllers with independent gain settings.
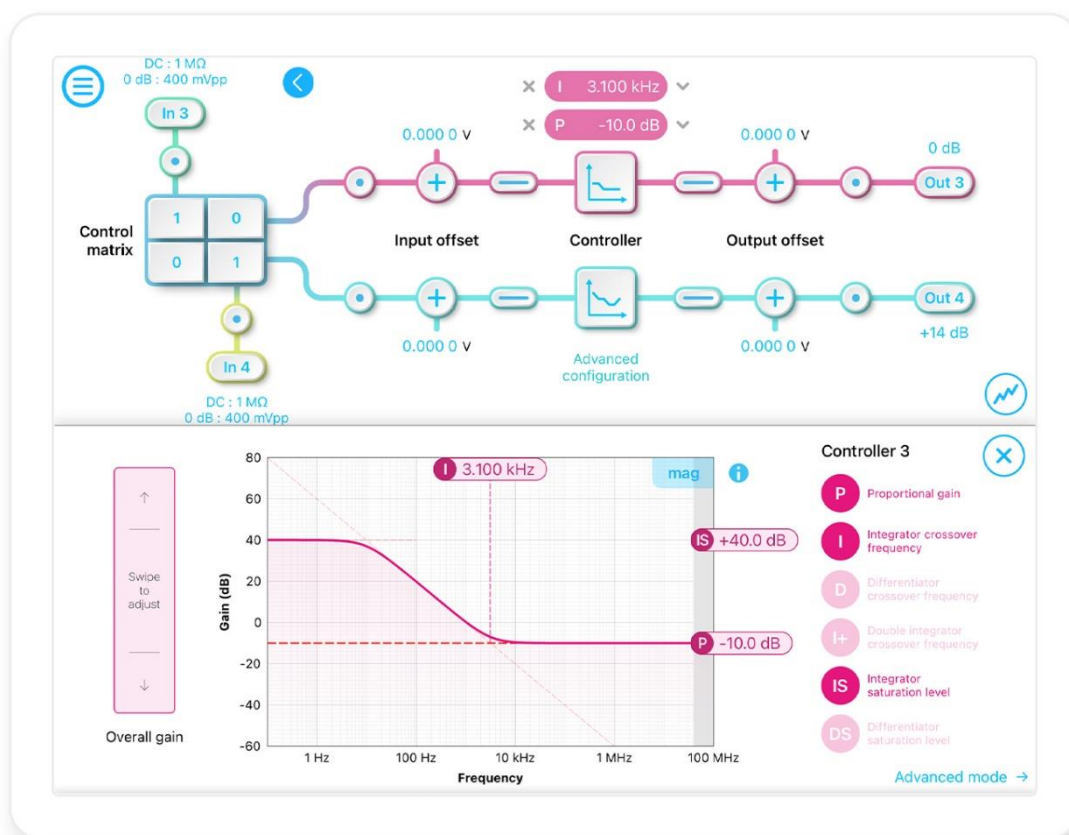

Features

- 4 input channels, 4 output channels, and 4 independent PID controllers with control matrix for MIMO
- Design the control system's frequency response using the interactive Bode plot in real time
- Block diagram view of the digital signal processing with built-in probe points in signal processing chain
- Advanced multi-section PID builder with single or double integrators and differentiators with low- and high-frequency gain saturation
- Integrated probe points for signal monitoring

General characteristics

Gain profiles	Proportional (P), integral (I), differential (D), double-integral (I+), integral saturation (IS), differential saturation (DS)
Maximum bandwidth	150 kHz with a phase delay of 30°
Input / output offset range	± 1 V
Offset precision	100 μV

### Gain characteristics

Gain profiles	Proportional (P), integral (I), differential (D), double-integral (I+), integral saturation (IS), differential saturation (DS)
Controller frequency range	DC to 40 MHz
Input / output offset range	± 1 V
Offset precision	100 μV
Proportional gain	± 60 dB
Integrator crossover frequency	3.125 Hz to 312.5 kHz
Double integrator crossover frequency	3.125 Hz to integrator crossover frequency
Integral saturation level	Between proportional gain and +60 dB The integrator saturation crossover frequency cannot be lower than 3.125 Hz
Differentiator crossover frequency	31.25 Hz to 3.125 MHz
Differentiator saturation level	Between proportional gain and +60 dB The differentiator saturation crossover frequency cannot be higher than 3.1 MHz

Moku:Pro's Spectrum Analyzer

Description

Moku:Pro's Spectrum Analyzer allows you to observe input signals in the frequency domain between DC and 300 MHz with an ultra-low noise floor. View four channels simultaneously with a resolution bandwidth as low as 2.2 Hz and a minimum span of 100 Hz. The Spectrum Analyzer also features four 500 MHz sinewave generators.
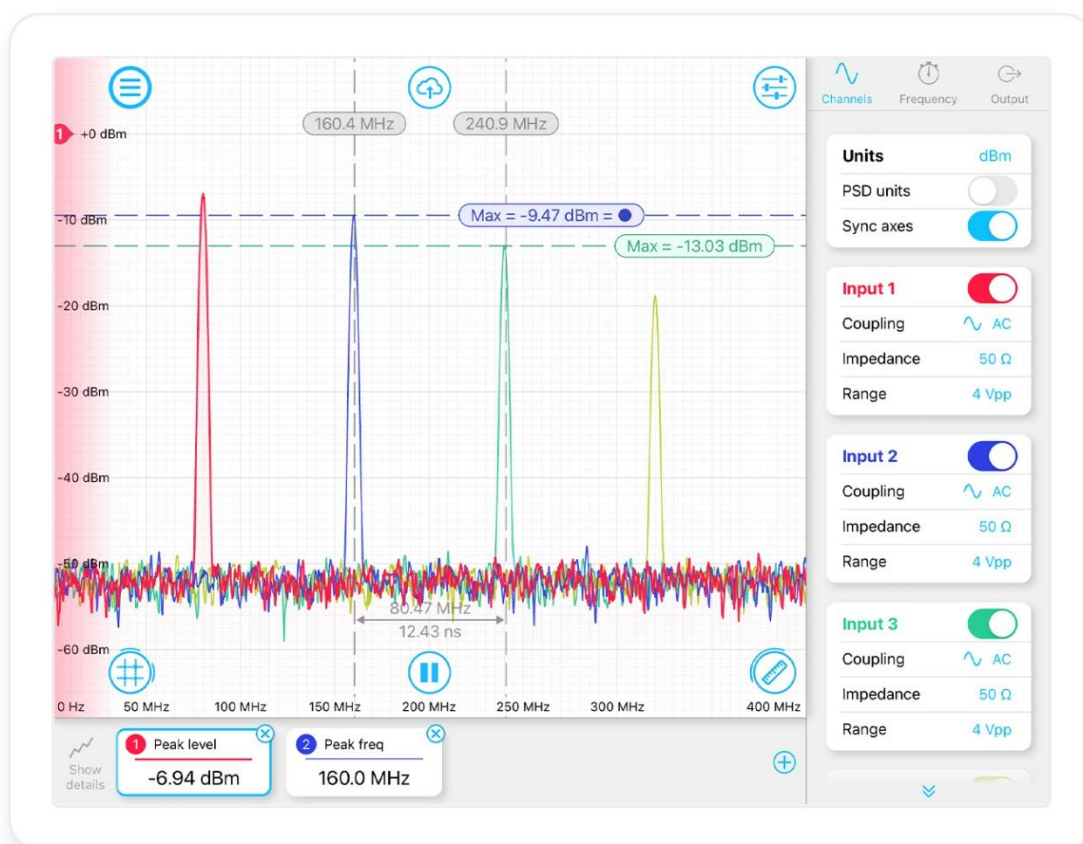

Features

- Display and record power spectra or power spectral densities in the frequency domain from DC to 300 MHz
- Generate four sine waves up to 500 MHz using Moku:Pro's built-in analog outputs
- Quickly measure important metrics by dragging measurement cursors onto features of interest using the iPad's multi-touch interface
- Live measurement functions: peak level, peak frequency, noise level, peak SNR, and occupied bandwidth

Moku:Pro's Waveform Generator

Description

Moku:Pro's Waveform Generator enables you to generate four independent waveforms with a maximum bandwidth of 500 MHz. Select between sine, square, ramp, pulsed, or DC waveform shapes. High bandwidth modulation of phase, frequency, or amplitude, or generate triggered bursts or sweeps from an internal or external source.
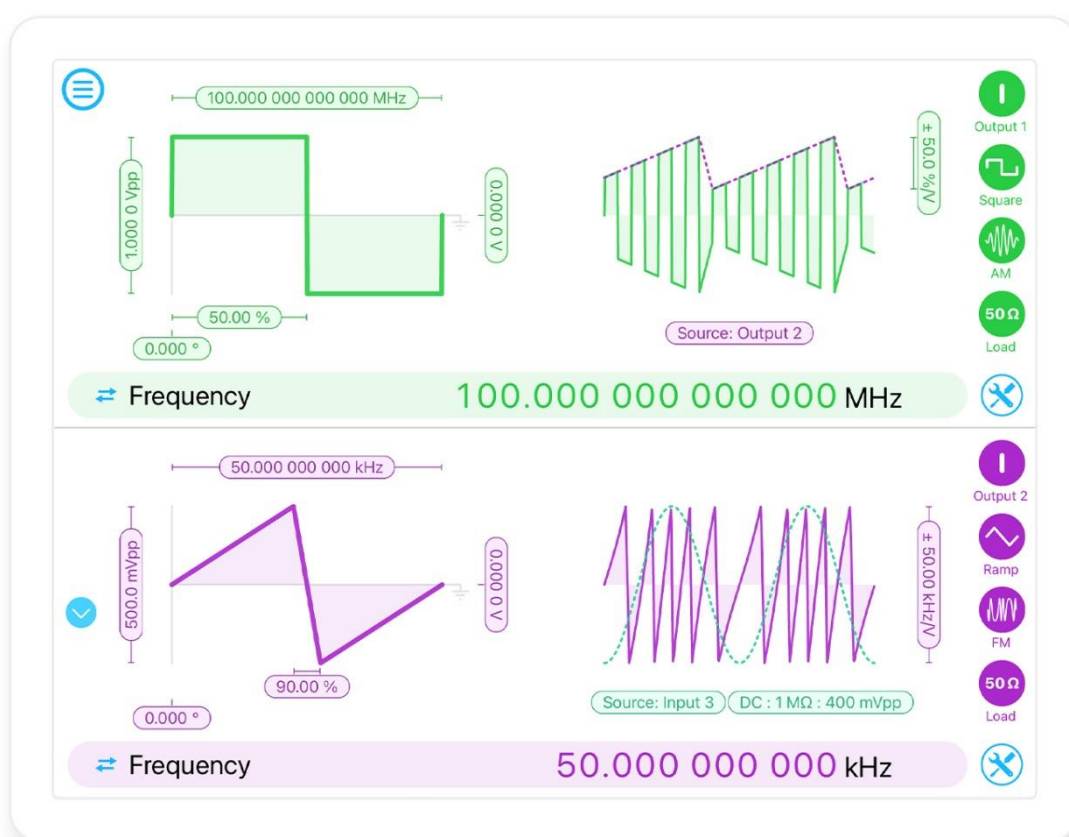

Features

- Generate 4 independent phase coherent waveforms from DC to 500 MHz Specifications.
- 5 built-in waveforms: sine, square, ramp, pulse, and DC.
- Broadband FM, AM, and PM modulation with internal waveform (cross-channel modulation) or external input.
- Versatile trigger options: from input, dedicated TTL trigger port, or another channel.
- 10 MHz reference input and output.

Common characteristics

Overview

Channels	4
Bandwidth (maximum output frequency)	500 MHz (2 Vpp into 50 Ω), 100 MHz (10 Vpp into 50 Ω)
Sampling rate	1.25 GSa/s per channel
Output impedance	50 Ω
Waveforms	Sine, Square, Ramp, Pulse, DC

Amplitude

Range	1 mV$_{pp}$ to 10 V$_{pp}$ into 50 Ω
Offset error	< 500 µV into 50 Ω
Resolution	100 µV
Units	V$_{pp}$, dBm

DC offset

Range (peak AC + DC)	± 5 V into 50 Ω
Resolution	100 µV

Phase offset

Moku:Pro's Multi-Instrument Mode

Description

Moku:Pro's Multi-Instrument Mode enables to you deploy up to 4 instruments and operate them simultaneously. These instruments can exchange high-speed, low latency signals between themselves in the digital domain at 5 Gb/s. Source signals from the real world via the blended ADCs and drive signals to the real world via the high-speed digital-to-analog converters. Connect instrument slots to build customized signal processing chains, or drop a custom configuration in one slot with Moku Cloud Compile.

Features

- Configure 4 independent instruments, operating simultaneously
- Each of the instrument slots has 2 inputs & 2 outputs
- Flexible multiplexing allows all 4 slots to access all 4 ADC inputs and all 4 DAC outputs
- High speed, 5 Gb/s inter-instrument communication with drag and drop setup
- Configurable input and output ranges, one touch slot synchronization

Common characteristics

Overview

Instruments	Up to 4, each with 2 inputs and 2 outputs
Inputs / outputs	4 analog inputs, 4 analog outputs
Input ranges	400 mVpp, 4 Vpp, 40 Vpp
Input bandwidth	300 MHz
Input sampling rate	1.25 GSa/s per channel
Input impedance	50 Ω / 1 M Ω
Output ranges	2 Vpp, 10 Vpp into 50 Ω
Output bandwidth	500 MHz at 2 Vpp, 100 MHz at 10 Vpp
Output sampling rate	1.25 GSa/s per channel
Output impedance	50 Ω
